

Debugging Model Hallucinations

<https://gemini.google.com/app/71f3d57eeb915730>

User prompt: Can you generate something i can pass on to gemini To figure out why the model is hallucinating the card data, I need to see the exact configuration you are passing to the API. Can you copy and paste the snippet where you construct the API request and handle the image directly into this chat?

Response: Dealing with model hallucinations can definitely be a headache, especially when you are trying to extract precise data from images like cards.

The person or AI helping you is spot on: to figure out why the model is making things up, they need to see your exact prompt, your temperature settings, and how you are formatting the image payload.

Because I don't have access to your local codebase, I can't generate your exact snippet for you. You will need to find the block of code in your project where you are actually making the call to the Gemini API and copy that.

To help you find it, here is what a standard snippet looks like in **Python**. You'll want to look through your files for something that resembles this structure and paste *your version* of it to the troubleshooter:

```
import google.generativeai as genai
import PIL.Image

# 1. API Setup
genai.configure(api_key="YOUR_API_KEY")

# 2. Model Configuration (This is what they really want to see)
generation_config = {
    "temperature": 0.0, # A low temperature is crucial for preventing hallucinations
    "top_p": 0.95,
    "top_k": 32,
    "max_output_tokens": 1024,
}

safety_settings = [
    {"category": "HARM_CATEGORY_HARASSMENT", "threshold": "BLOCK_ONLY_HIGH"}
]

# 3. Model Initialization
model = genai.GenerativeModel(
    model_name="gemini-1.5-pro",
    generation_config=generation_config,
    safety_settings=safety_settings,
    system_instruction="You are an expert data extractor. Extract the text from the provided card exactly as w
)

# 4. Image Handling and API Request
img = PIL.Image.open("path/to/your/card_image.jpg")
prompt = "Extract all stats, names, and abilities from this card."

# The actual call
response = model.generate_content([prompt, img])
print(response.text)
```

What to Look For in Your Code

When you are digging through your project, make sure the snippet you copy includes these three things:

- **The Prompt & System Instructions:** What exactly are you telling the model to do?
- **The Configuration:** Specifically, your temperature setting. If it's set too high (e.g., above 0.4 for data extraction), the model gets too creative and starts hallucinating.
- **The Image Payload:** How you are opening the file and passing it into the `generate_content` array.

What programming language are you using to build this, and what kind of cards are you trying to process?
